## Problem Statement

### US Used Car Dealership Asset Appraisal

- US based used car dealership currently has a large stock of vehicles
- The dealership needs a new way to determine the value of their vehicles for stocktake and purchasing
- Current method involves driving to other car lots and trying to find similar cars with prices
- The dealership has +50 lots nationwide

## Dataset:

## “Used Car Dataset”

Kaggle user built a web scrapper that scrapes [craigslist.org](https://craigslist.org)'s used car section nationwide. New data is published every few months.

25 features and 426,880 records

## Example Craigslist Listing

**Will**  
 Folks here we have one of the toughest cars known to mankind. This car can easily exceed a million miles. Especially with the great service history that it has. This was an one family car. The car purchased it from his father at 17 thousand miles. It has been serviced in West county its whole life. Recent repairs: Refurbished A/C system, a new power steering pump, and a complete timing belt kit. (this was finished at one hundred and forty two thousand miles). This car features a lot of power being a 6 cylinder. Also gets great fuel economy. Everything works, it needs absolutely nothing. You will get your money worth out of this car. Come on out, and take it for a test drive on the four lane hwy right around the corner from our house which is where the car is kept. These vehicles are a very high Craigslist vehicle, for a good reason. You can Research, I have been safety and am insured.

## Data Cleansing:

### What is a VIN (Vehicle Identification Number)?

- 17 alphanumeric identifier required for all manufactured vehicles
- Encoded with information about the vehicle
- Standardised after 1981
- I,O,Q not allowed to prevent confusion with similar letters and numbers
- 9th digit check digit to prevent fraud
  - (sum 16 digits and divide by 11)

#### VIN Decoder Diagram

## Data Cleansing: Filling Missing Values with VIN Decoder

### NHTSA Website VIN decoder

- NHTSA has a publicly available VIN decoder API
- Able to return missing values for all of the vehicle description features except color, title status and condition
- Built a multistep function to call API, deal with connection errors, store results, decode the results and fill the missing values
- Ran the function on segments of the data set to ensure function was working properly and could handle various errors
- Overwhelmed the API several times and needed to use backoff delays
- Used ThreadPool to decode multiple VIN simultaneously
- Used tqdm to display progress bar as the process took over 12 hours, needed to be sure it was running
- Extremely accurate but time consuming
  - It's possible to build a decoder locally and avoid the API

NHTSA's VIN decoder allows you to query a particular vehicle's VIN to identify specific information encoded in the number.

VIN:

Partial VINs are also accepted

Model Year:

It entered the year from VIN will be ignored

**GMC 2014 GMC - TRUCK**

✓ Green Text: VIN decoded clean. Check Data Entry system is correct

Manufacturer: **GENERAL MOTORS LLC**

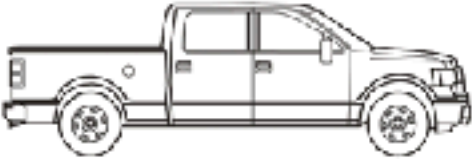

Make: **GMC**

Model: **Sierra**

Model Year: **2014**

Vehicle Type: **TRUCK**

Body Class: **Pickup**

**Other Information**

Information provided below is based on the details provided by the manufacturer of this vehicle to NHTSA in the past 555 submitted

Series: <b>1500</b>	Trim: <b>SLT</b>
Gross Vehicle Weight Rating: <b>6,000 lb (2,722 kg)</b>	Axis: <b></b>
Engine Displacement (L): <b>5.0</b>	Axis Configuration: <b></b>
Drive Type: <b>Four-Wheel Drive</b>	Cylinders: <b>8</b>
Primary Fuel Type: <b>Gasoline</b>	Engine Model: <b>6.0L V8 AFM (Active Fuel Management), Aluminum</b>
Secondary Fuel Type: <b>None</b>	Displacement Level: <b></b>
Engine Brake (HP): <b></b>	Engine Manufacturer: <b></b>
Transmission Speed: <b></b>	Transmission Style: <b></b>

## Data Cleansing: Filling Missing Description Reader

- Craigslist form has mandatory (red) and optional fields.
- All of the categorical fields (except make and model) are predefined drop down lists
- Often information for the categorical fields was written as part of the description.
- A list of the unique values(keywords) for a selection of features and the feature name were used to make a set of dictionaries i.e { paint colour: "red", "blue","green",....} A function was created to scan all of the "descriptions" in the data set and return the matching key value pairs i.e {paint colour:'red'}
- This was highly effective but more prone to errors

Actual description submitted by user **Keyword**

Craigslist posting form

The screenshot shows the Craigslist posting form. The 'description' field is highlighted with a red border. An arrow points from the text block on the left to this field. The form includes various dropdown menus and checkboxes for additional details.

# Data Cleansing:

## Wrap up

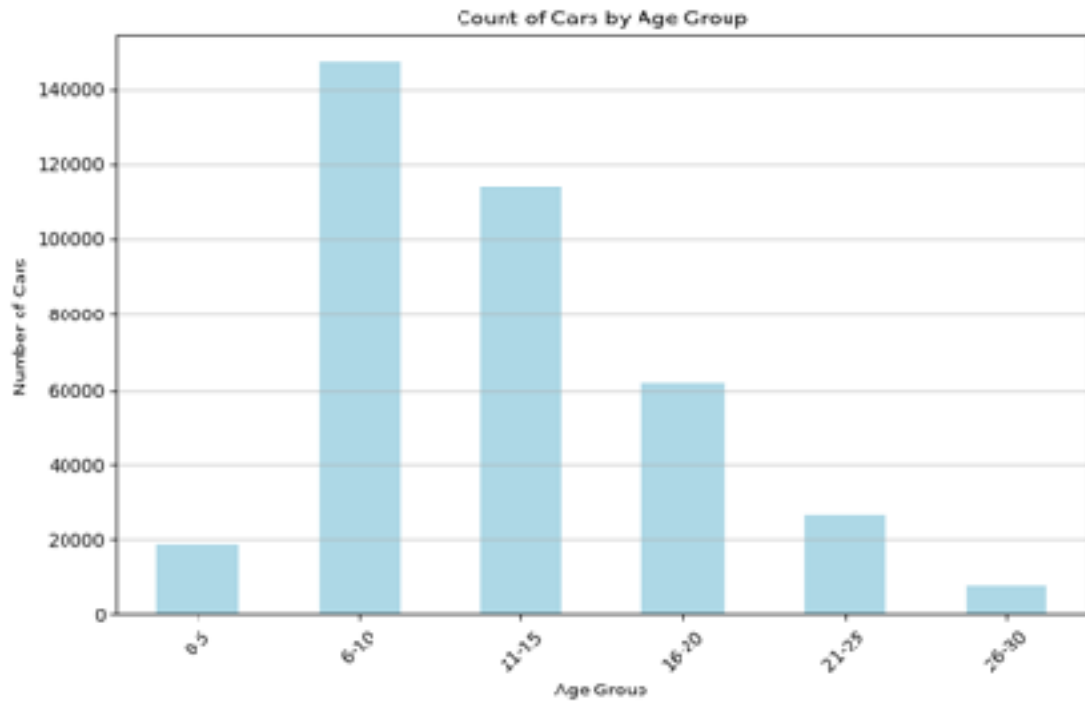

1. Dropped outliers
2. VIN Decoder API
3. Description dictionary
4. Grouped by “odometer” and “condition” to fill “condition”
5. Dropped unnecessary features
6. Dropped NAs
7. Used Label Encoder to transform categorical features into numerical features

## Conclusion

### US Used Car Dealership Asset Appraisal

- The model performs well and can predict the price of a used car
- Far better outcome than employees driving to other car lots to check prices. Time savings and accuracy
- There is likely some overfitting but this could be addressed with further hyper tuning
- From the model results it is likely that the relationship is not linear and better modelled using a non-linear modelling technique i.e random forest
- The model will not perform well with outliers i.e supercars or custom cars
- The model will need to be updated with new data from craigslist on a regular basis
- Computationally heavy and time consuming to perform updates on a local computer. National head office should house on their server and allow locations to call the model.
